

CL11 – Quiz 2 Review

# Reminders

- Please submit any regrade requests for Quiz 01 by tomorrow at 11:59pm!
- **EX02** – Wordle due Sunday, June 1 at 11:59pm
  - In-person Office Hours: Today 1-3pm
  - Virtual Office Hours:
    - Today 3-5pm
    - Sunday 1-5pm

Consider the following code:

```
my_2d_list: list[list[str]] = [["a", "b", "c"], ["d", "e", "f"]]
```

1. What would `my_2d_list[0][1]` evaluate to?
2. Write one line of code that would change `"d"` to `"r"`.

Consider the following code:

```
1    val:          = [22, 14, 3][int(["0", "2", "1"][1])]
```

1. Which side of the assignment operator (=) should we evaluate first?
2. What literal value will the expression on the right-hand side evaluate to?
3. Fill in the blank: what *data type* should be written to complete `val`'s declaration?
